

There are several advantages to choosing liquid chlorine (Sodium Hypochlorite) over a dry tablet system: First, it's far more soluble. Meaning it dissolves easily into the water, leaving you with clearer water faster. Second, it's easy to use. Simply pour the designated amount directly into the swimming pool. If you want to make things even easier, get a liquid chlorine feeder such as The Liquidator®. That way you will not have to change the chlorine for up to 4 weeks. Third, it works faster. In the water it immediately turns to Hypochlorous Acid, this is the killing form of chlorine, and it goes to work the second it's poured into the pool. Fourth, it's safer. You will not have to worry about having a tablet feeder floating around in your pool all of the time, which can be unsafe for children and pets.
